Consulting for AbbVie, Astra-Zeneca, BeiGene, Bristol Myers Squibb, Caribou Biosciences, Cellectar, Genentech, Incyte, Interius, Janssen, Kite Pharma, Lilly, Regeneron, Takeda

# A walk down memory lane...

## The working formulation!

Histologic type of lymphoma

High-grade large-cell immunoblastic

High-grade lymphoblastic

High-grade, with small noncleaved cells

Intermediate-grade follicular, with  
predominantly large cells

Intermediate-grade diffuse, with small  
cleaved cells

Intermediate-grade diffuse, with mixed  
small and large cells

Intermediate-grade diffuse, with  
large cells

Other diffuse

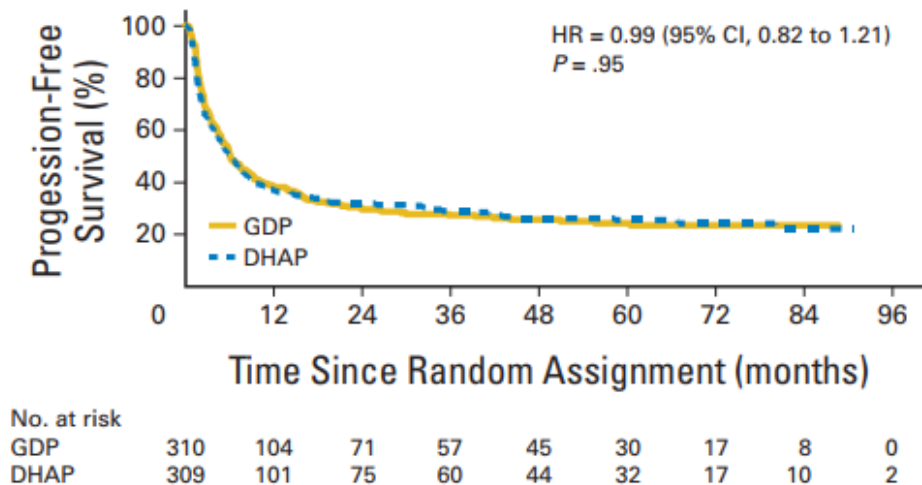

M-BACOD, MACOP-B, PROMACE-CytaBOM still in use for DLBCL (or whatever it was called back then)

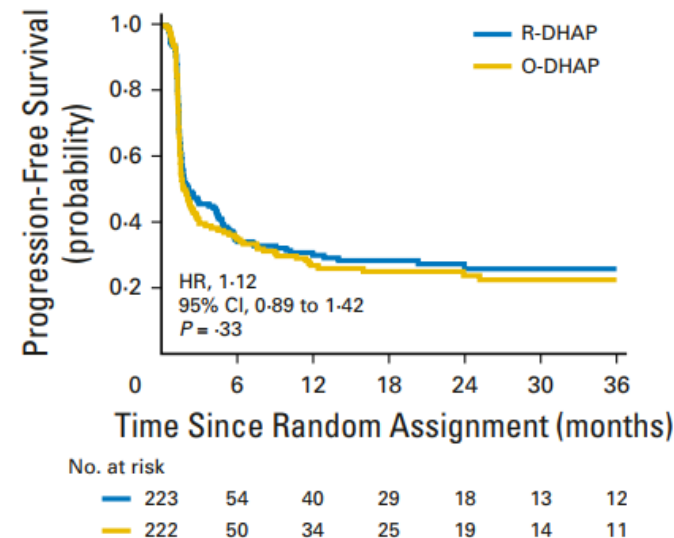

# Platinum based chemo and ASCT Just Ain't What it Used To Be...

- About 3/4 of DLBCL relapses happen within one year of frontline therapy
- Plus, only half of relapsed DLBCL patients are candidates for HDT/ASCT
- Chemo +/- ASCT fails the vast majority of patients with relapsed DLBCL today

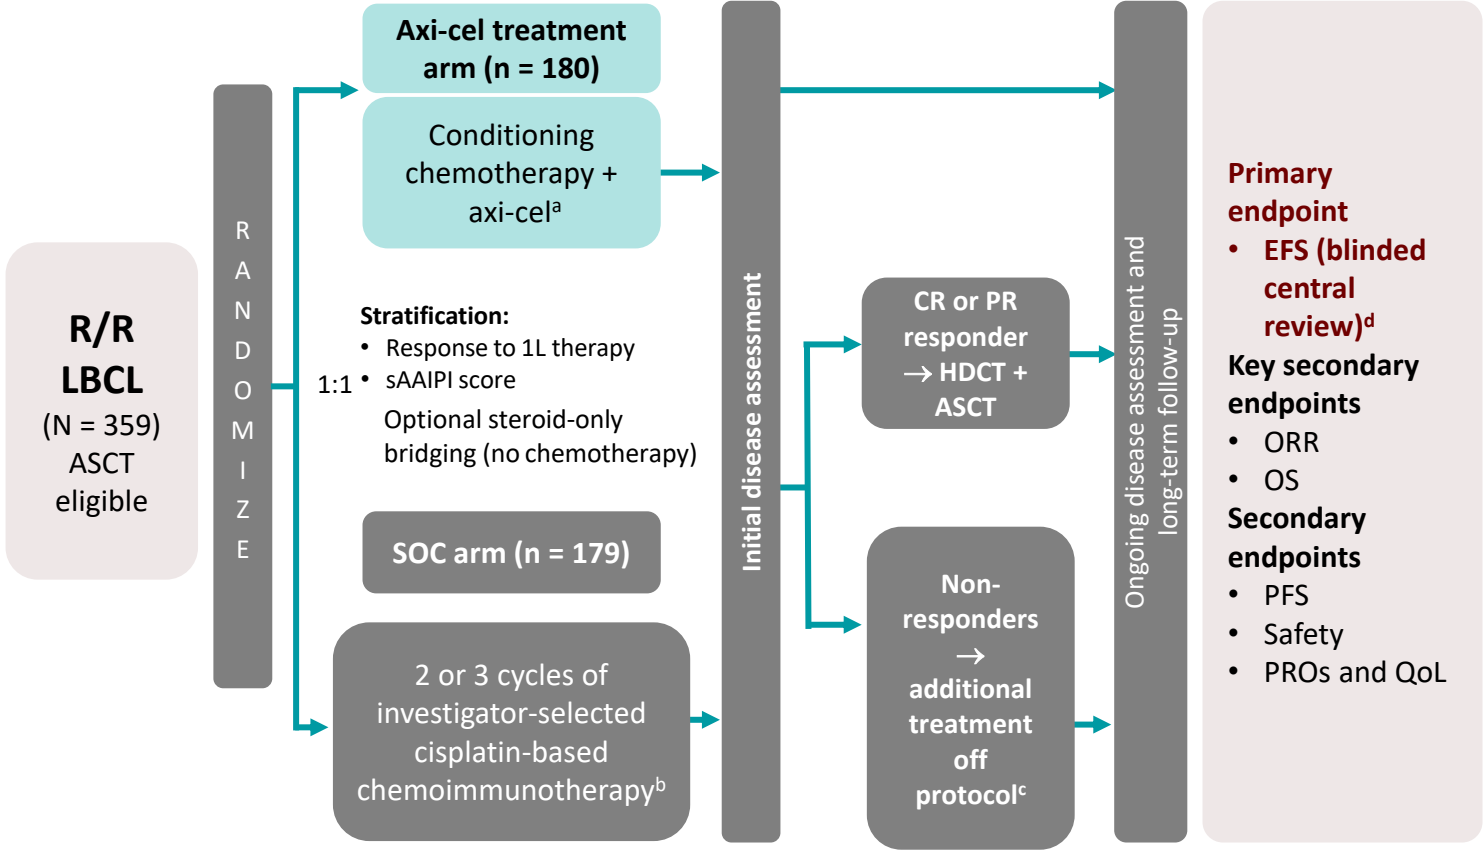

# Three randomized trials of Chimeric Antigen Receptor (CAR) T-cell therapy versus SOC in transplant-eligible DLBCL with early relapse or primary refractory disease

Inter-trial comparisons should not be made because of differences in study design, patient populations, treatment interventions, and duration of follow-up, among others. We cannot make direct comparisons or draw conclusions from one trial to another.

# ZUMA-7: axi-cel versus SOC in 2L LBCL

Characteristics	Axi-cel (n = 180)	SOC (n = 179)
Median age (range), years	58 (21–80)	60 (26–81)
Disease stage III-IV, n (%)	139 (77)	146 (82)
<b>Primary refractory, n (%)</b>	<b>133 (74)</b>	<b>131 (73)</b>
<b>Relapse ≤ 12 months of 1L therapy, n (%)</b>	<b>47 (26)</b>	<b>48 (27)</b>
<b>HGBCL (incl. DHL/THL), n (%)</b>	<b>31 (17)</b>	<b>25 (14)</b>
ECOG PS of 1	85 (47)	79 (44)
Elevated LDH level	101 (56)	94 (53)

**Axi-cel has been approved by FDA for adult patients with LBCL that is refractory to first-line chemoimmunotherapy or relapses within 12 months of first-line chemoimmunotherapy**

Data cutoff: March 18, 2021.

<sup>a</sup> Axi-cel patients underwent leukapheresis followed by conditioning chemotherapy with Cy (500 mg/m<sup>2</sup>/day) and Flu (30 mg/m<sup>2</sup>/day) 5, 4, and 3 days before receiving a single axi-cel infusion (target intravenous dose, 2 × 10<sup>6</sup> CAR T cells/kg). <sup>b</sup> Protocol-defined SOC regimens included R-GDP, R-DHAP, R-ICE, or R-ESHAP. <sup>c</sup> 56% of patients received subsequent cellular immunotherapy. <sup>d</sup> EFS was defined as time from randomization to the earliest date of PD per Lugano Classification. <sup>e</sup> Disease type according to central laboratory.

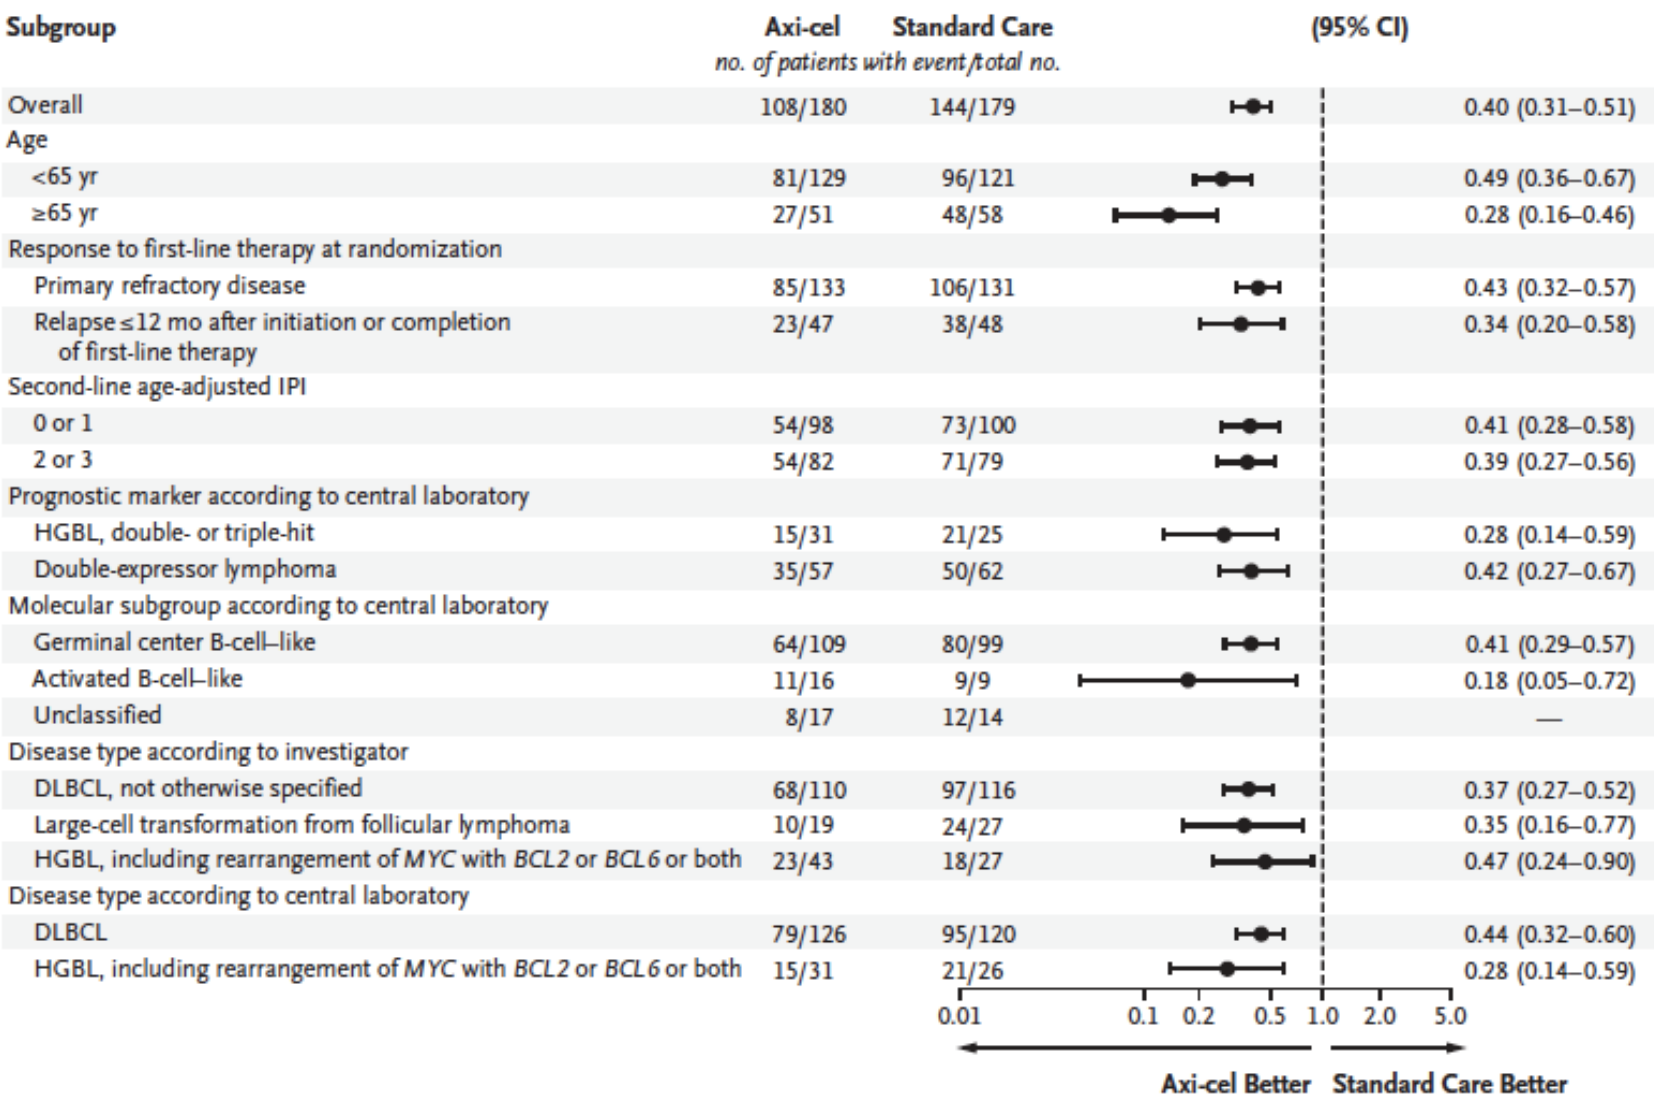

1L, first line; PRO, patient-reported outcome; QoL, quality of life; R-ESHAP, rituximab, etoposide, methylprednisolone, high-dose cytarabine, cisplatin; R-GDP, rituximab, gemcitabine, dexamethasone, cisplatin;

R-ICE, rituximab, ifosfamide, carboplatin, etoposide; sAAPI, second-line age-adjusted International Prognostic Index; THL, triple-hit lymphoma.

# EFS improvements with axi-cel versus SOC were consistent among key patient subgroups

March 21, 2023

## Axi-cel CAR T-cell Therapy Demonstrates a Statistically Significant Improvement in Overall Survival for Initial Treatment of Relapsed/Refractory Large B-cell Lymphoma

*-- First and Only Treatment in Nearly 30 Years to Show Statistically Significant Improvement in OS for Initial Treatment of R/R LBCL Patients Versus Historical Standard of Care in Curative Setting --*

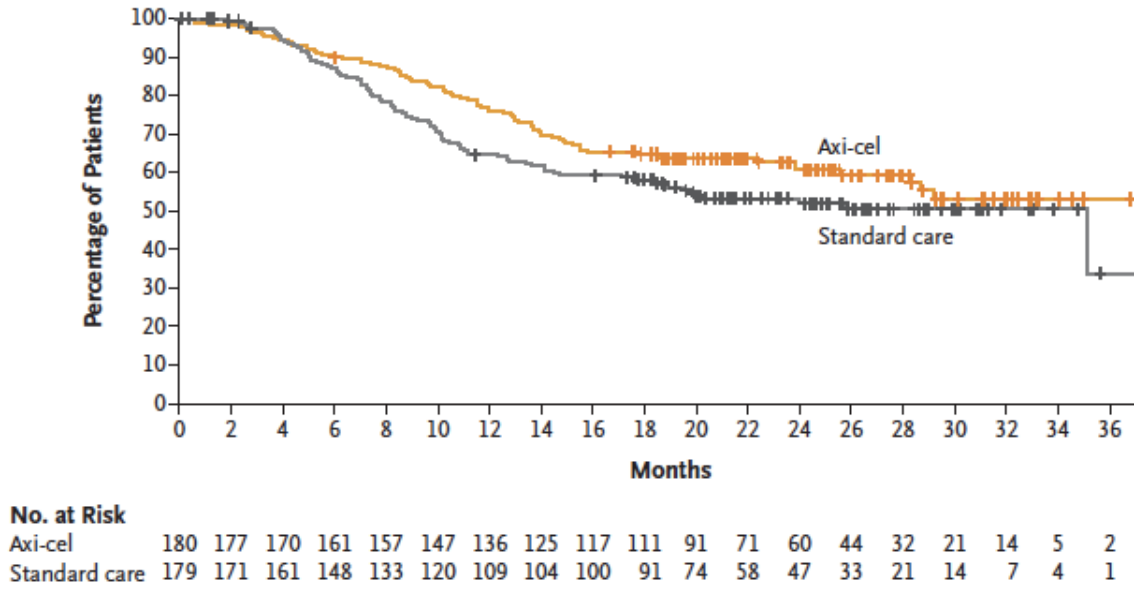

*-- Landmark ZUMA-7 Study OS Data Reach Maturity Per Protocol, 5 Years After 1<sup>st</sup> Patient Randomized --*

SANTA MONICA, Calif.--(BUSINESS WIRE)-- Kite, a Gilead Company (Nasdaq: GILD), today announced the primary overall survival (OS) analysis results of the Phase 3 ZUMA-7 study. The results showed a statistically significant improvement for axi-cel in OS versus historical treatment, which was the standard of care (SOC) in a curative setting for nearly 30 years, for initial treatment of adult patients with relapsed/refractory large B-cell lymphoma (R/R LBCL) within 12 months of completion of first-line therapy. Historical SOC is a multi-step process involving platinum-based salvage combination chemoimmunotherapy regimen followed by high-dose therapy (HDT) and stem cell transplant (ASCT) in those who respond to salvage chemotherapy. These findings will be presented in full later this year at an upcoming scientific meeting.

# Overall Survival

OS

Median NR vs. 35.1 mos  
HR 0.73 (0.53-1.01)

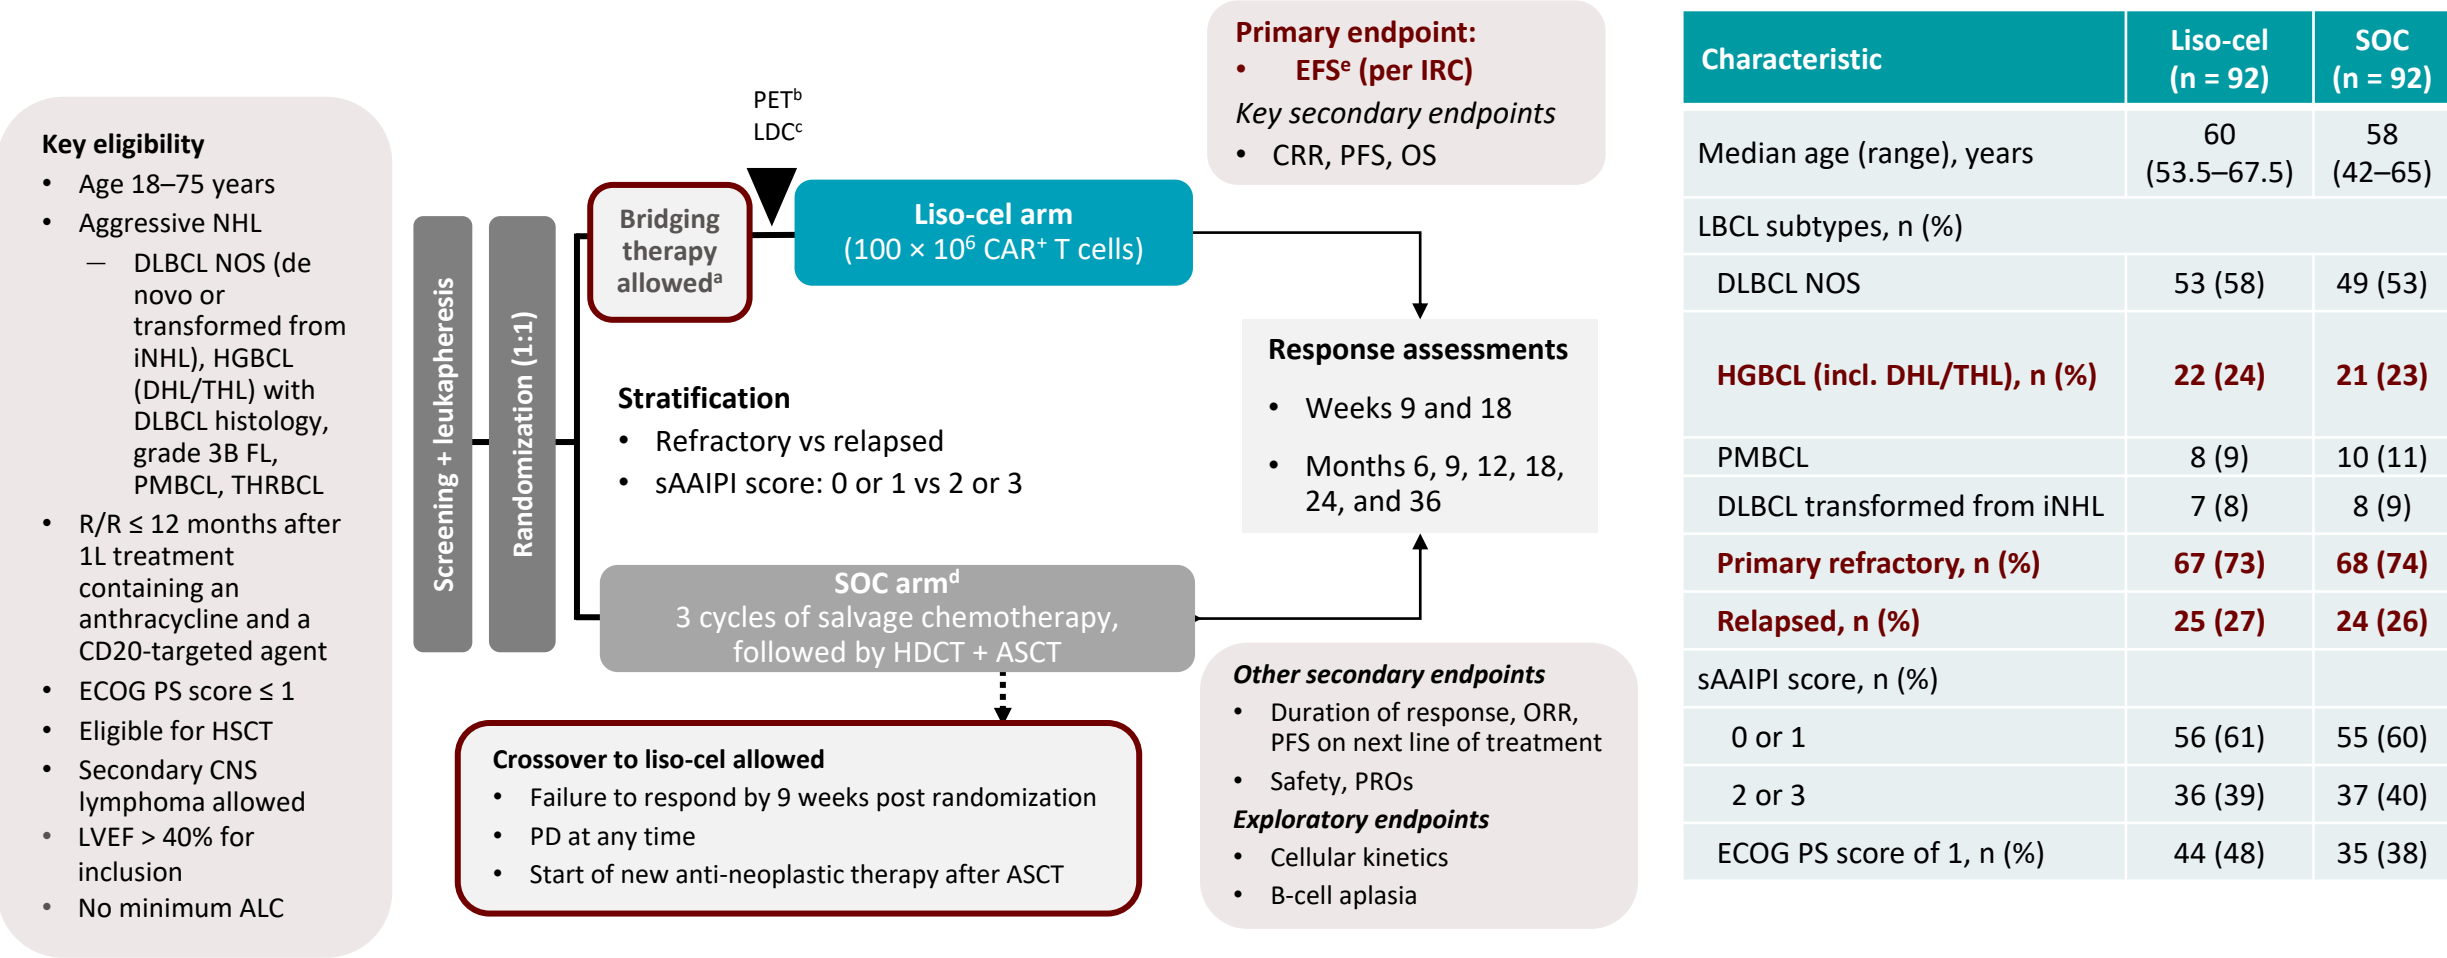

# ZUMA-7 SOC Patients Who Received 3<sup>rd</sup> Line CAR T-cells

- 127 of 129 (71%) of SOC patients required 3<sup>rd</sup> line therapy
- 68 received 3<sup>rd</sup> line CAR T-cells
  - ORR 57%, CRR 34%
  - Median PFS 6.3 mos
  - Median OS 16.3 mos

*Efficacy of CAR T-cells is greater in patients randomized to receive them as 2<sup>nd</sup> line therapy*

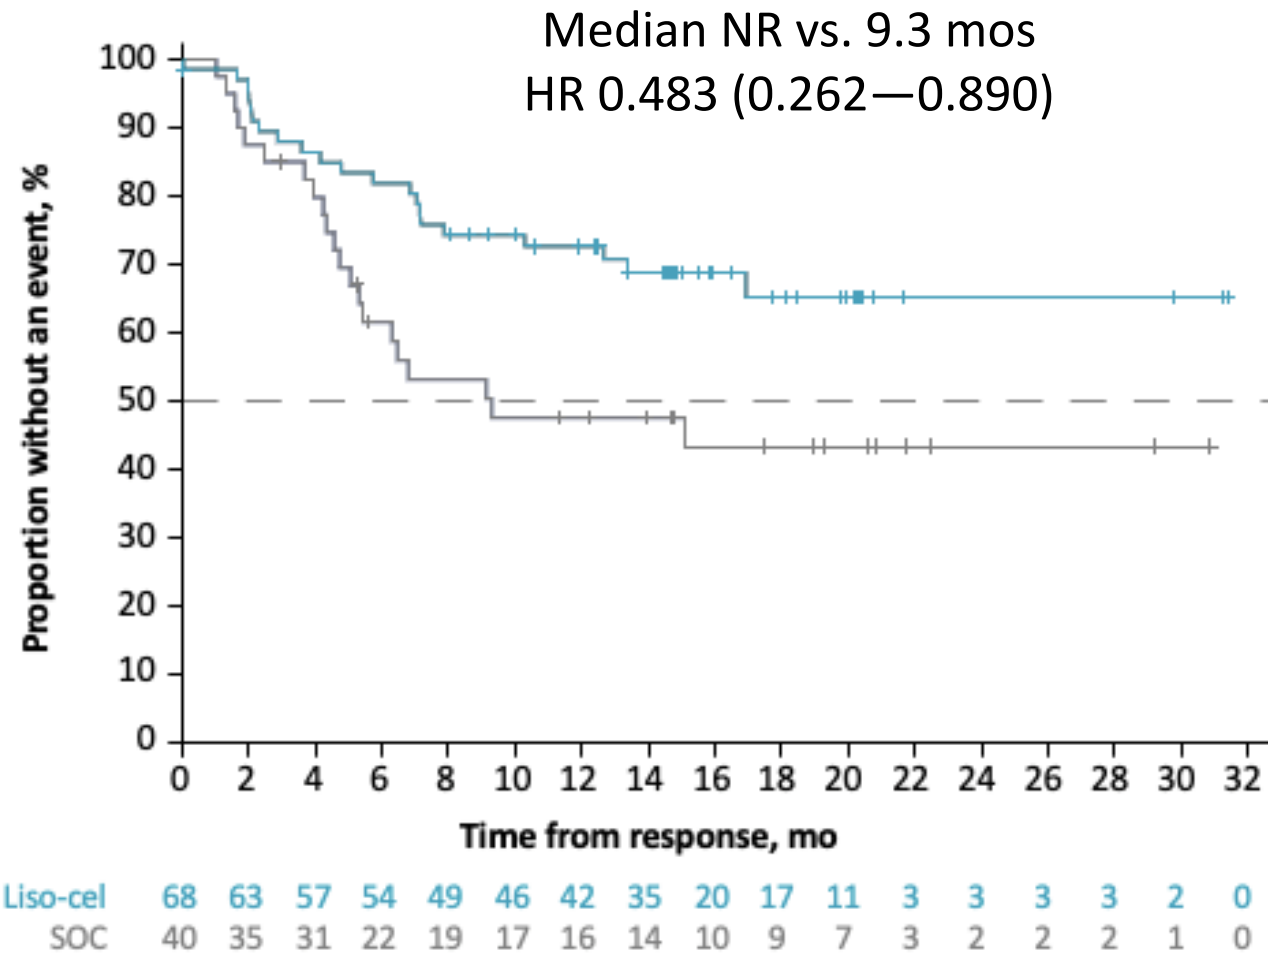

# TRANSFORM: liso-cel versus SOC in 2L LBCL

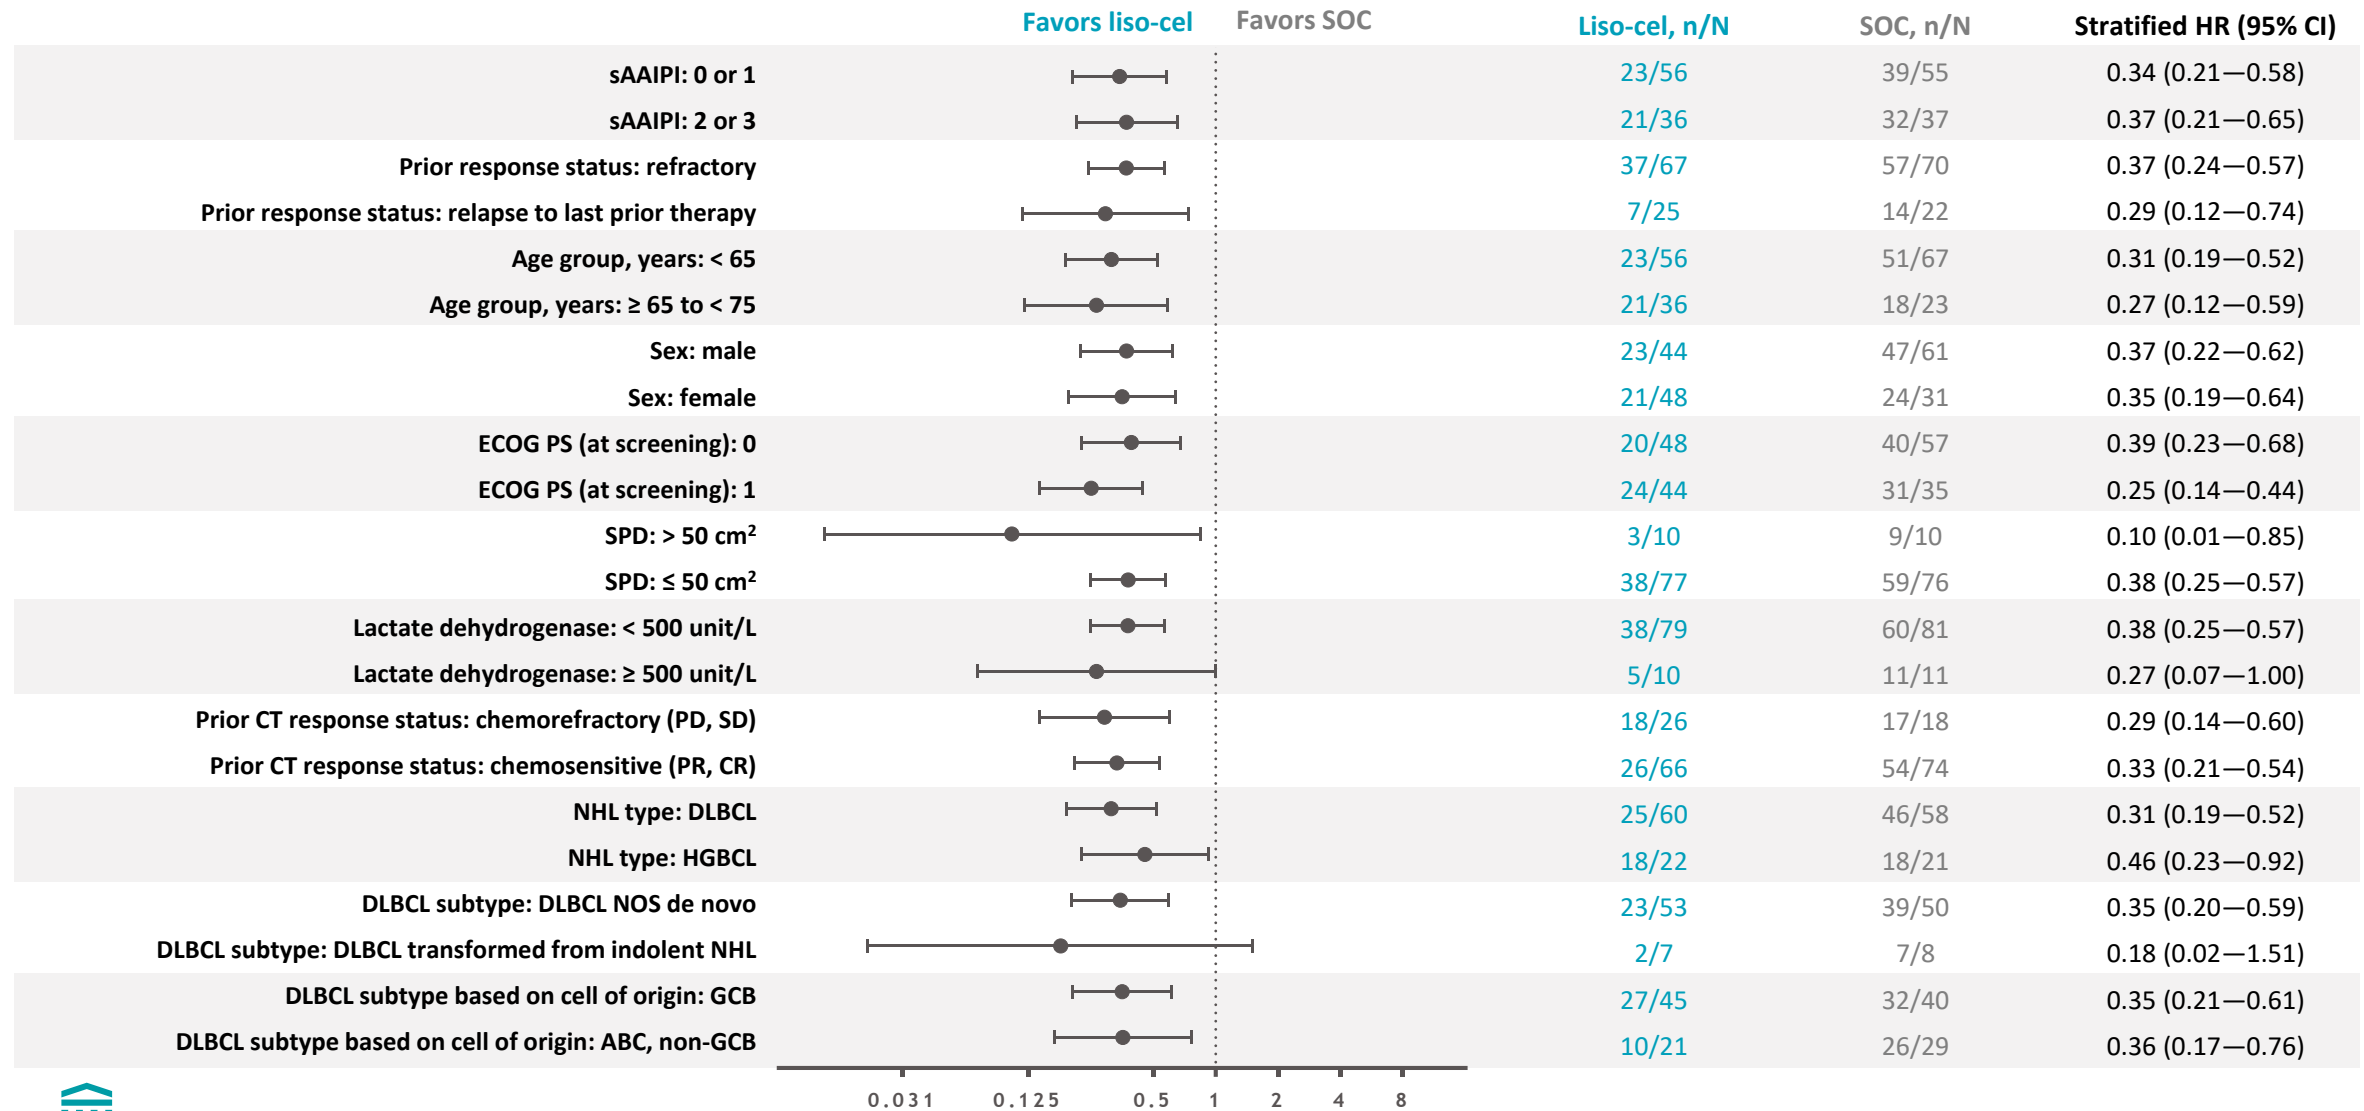

# Duration of Complete Response is Better with Liso-cel

# TRANSFORM: EFS per IRC by subgroup (ITT)

CT, chemotherapy; SD, stable disease; SPD, sum of the product of perpendicular diameters.

# TRANSFORM: Primary Mediastinal B-cell Lymphoma

	Liso-cel (n=8)	SOC (n=9)
Overall Response Rate	8 (100%)	3 (33%)
Complete Response Rate	8 (100%)	3 (33%)
Event-free survival, median	NR	2.2 m
Event-free survival, 18 m	87.5%	33%

# Liso-cel vs. SOC as 2<sup>nd</sup> line therapy: Overall Survival and Crossover

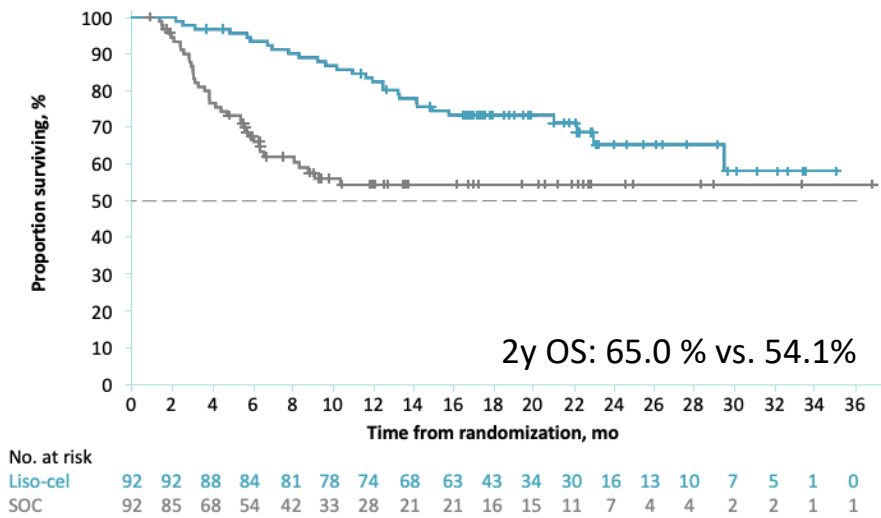

## OS

Median NR vs. 29.9 mos  
HR 0.724 (0.443—1.183)

## OS adjusted for crossover

Median NR vs. NR  
HR 0.415 (0.251—0.686)

## Crossover subgroup

N=61 (66% of SOC)

	Crossover subgroup (n = 57 treated)
Median time from crossover to infusion	15 days (range 12-26)
Median f/u	12.0 m (1.4—28.1)
ORR / CRR	61% / 53%
Median EFS	5.9 m (3.1—15.1)
Median PFS	5.9 m (3.2—26.5)
Median OS	15.8 m (11.8—NR)

Median Follow-up: 17.5 mo

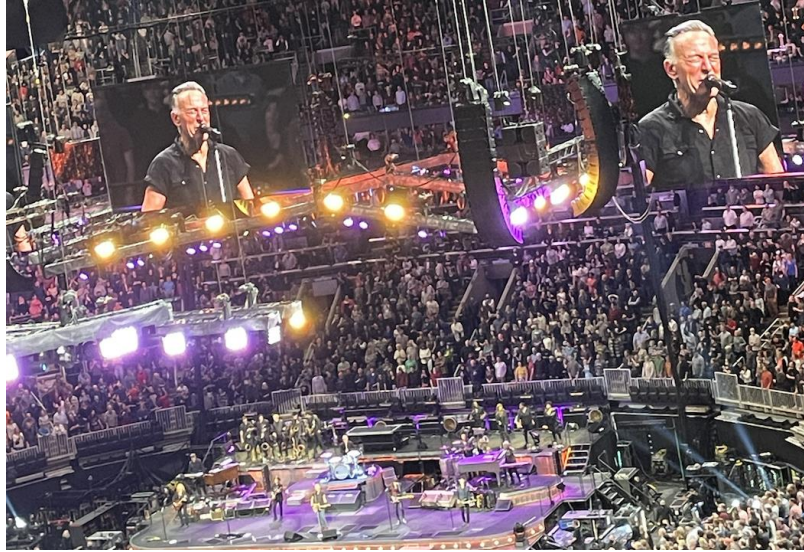

# Why use CAR over chemotherapy +/- ASCT in 2<sup>nd</sup> line?

- CAR T-cells **CURE MORE PATIENTS!**
- Only 16% of SOC patients on ZUMA-7 remained event free at 2 years!
- Patients (and their T-cells) are more beat up after failing 2<sup>nd</sup> line chemotherapy, and may not be able to get to CAR T-cells in the 3<sup>rd</sup> line setting
- Patients receiving 3<sup>rd</sup> line CAR after failing SOC on TRANSFORM and ZUMA-7 **didn't do as well** as patients getting CAR 2<sup>nd</sup> line
- **Overall survival is emerging in favor of CAR** over SOC in both ZUMA-7 and TRANSFORM despite having CAR T-cells as a 3<sup>rd</sup> line therapy

# 2<sup>nd</sup> line ASCT in DLBCL? Not in the CAR era (for most patients)!

The 80s rockers can still bring it when needed (*young fit pts with late relapse, but this is a small group*)

Since the 80s, even Mr. T has evolved

Thank you for your attention!
